关于本应用

About this app

本应用是传统中国历法（通书／黄历）的计算器与参考工具：以天文算法推算历法层（干支、节气、农历、置闰），并按典籍通行规则编码择吉层（建除、黄黑道、二十八宿、神煞），逐项给出宜忌参考。

This app is a calculator and reference for the traditional Chinese almanac (Tong Shu / Huangli): it computes the calendrical layer (sexagenary cycle, solar terms, lunisolar dates, leap months) with astronomical algorithms, and encodes the day-selection layer (12 officers, yellow/black path, 28 mansions, spirits) per named classical rules, giving per-activity guidance.

本应用不是算命服务、不构成专业建议、不能替代择日师。所有裁断为「依传统规则的推算参考」，绝非定论；婚丧、动土、开业等大事请以纸本通书或专业人士为准。

It is not a fortune-telling service, not professional advice, and not a substitute for a practitioner. Every verdict is computed guidance per stated traditions — never definitive. For weighty matters (marriage, burial, ground-breaking, opening) confirm with a printed almanac or a specialist.

方法 Method

方法：天文层采用 Meeus 级算法按定朔定气推算，民用日以东八区（UTC+8）为准，置闰依「无中气置闰」规则（参照 GB/T 33661-2017《农历的编算和颁行》）。择吉层依《协纪辨方书》等通行规则编码，并按置信度分级（高／中）；低置信、版本分歧大的项目不计分或明示未纳入。界面以「精确／分级」标签区分两层。

Method: the astronomical layer uses Meeus-grade algorithms with true new moons and true solar terms; civil days follow UTC+8; leap months follow the no-zhongqi rule (per GB/T 33661-2017). The interpretive layer encodes rules per the Xieji Bianfang Shu and common almanac practice, graded by confidence (H/M); low-confidence or divergent items are unscored or explicitly omitted. The UI tags every datum as exact or graded.

隐私 Privacy

隐私：本应用不收集、不上传任何数据；全部计算在设备本地完成，可完全离线使用。设置仅存于当前会话并编码进可分享链接。

Privacy: the app collects and transmits nothing; all computation is on-device and works fully offline. Settings live only in the session and the shareable URL.

信任与边界

Trust & limits

「精确」=可验证的推算事实：儒略日、干支、节气与朔的时刻、农历月日与置闰、冲煞对象、时辰黄黑道。

"Exact" = verifiable computed facts: JDN, pillars, term/new-moon instants, lunisolar dates and leaps, clash targets, hour path.

「分级」=传统断语：建除宜忌、宿吉凶、神煞及其权重。各书有出入，故标置信度且可调取向。

"Graded" = traditional readings: officer suitability, mansion luck, spirits and weights. Sources differ, hence confidence grades and profiles.

未纳入（宁缺毋造）：逐日胎神六十日表；不将日与嫁娶周堂；安葬山向·墓运·年克山家；财神／福神／贵神方位（各家不一，仅收通行之喜神）；时家神煞（日禄、天乙贵人、喜神时等）；以及低置信神煞——天愿、月恩、时德、五合、鸣吠、大小耗、游祸、五墓、月刑。待有可靠出处再行加入。

Deliberately omitted (never fabricated): the 60-day Fetal-God table; Bujiang days & the marriage Zhoutang chart; burial mountain-facing / grave-luck; Wealth/Fortune/Noble-god directions (only the common Joy-god is kept); hour-family spirits (day-lu, Tianyi noble, joy-hour); and low-confidence spirits — Tianyuan, Yue'en, Shide, Wuhe, Mingfei, Da/Xiaohao, Youhuo, Wumu, Yuexing. Each returns only with a verified source.

本应用所有输出均为依传统规则之推算参考，非定论、非建议。

All output is computed guidance per stated traditions — not definitive, not advice.

常见问题

FAQ

为什么和我的纸本通书不一样？ Why does my printed almanac disagree?

三个常见原因：①各书收录的神煞集合不同（本应用只计高／中置信项）；②二十八宿相位各家或异（可在工具里一键校准）；③宜忌断语本就存在地域与师承差异。历法层（干支、节气、农历）若不一致，请用「精度核对」查证——这一层是可验证的。

Three common causes: different spirit sets (we score only H/M-confidence ones); different 28-mansion phase (calibrate in Tools); regional/lineage variation in readings. If the calendrical layer disagrees, check the Accuracy tool — that layer is verifiable.

加了生日后结论变了？ The verdict changed after I added my birthday?

是的——本命冲日会被筛除或降级，五行排序也会按你的喜用调整。这是个人化筛选，不是历法变了。

Yes — days clashing your natal sign get screened or demoted, and elemental sorting follows your favored elements. Personalization, not a calendar change.

什么是闰月？ What is a leap month?

农历月按朔定，12个朔望月比回归年短约11天；为对齐四季，约每19年加7个闰月。规则：自冬至到下一冬至若含13个月，第一个不含中气的月为闰月，沿用上月之名（如2025闰六月）。

Lunar months track new moons; 12 of them run ~11 days short of the solar year, so ~7 leap months are inserted per 19 years. Rule: in a 13-month winter-solstice-to-winter-solstice span, the first month without a zhongqi becomes the leap month (e.g. leap-6th of 2025).

为什么有些项目写「未纳入」？ Why are some items "omitted"?

因为可靠出处不足或各家版本互斥。本应用宁可空缺并说明，也不臆造数据；清单见「信任与边界」。

Toon Shu Data Selector User Guide v1.0

这是算命吗？ Is this fortune-telling?

不是。这是传统民俗历法的计算与查询工具：把典籍写明的规则如实算出来并标注置信度，不做预言、不保证结果、不提供个人命运判断。

No. It is a calculator for a folk-calendrical tradition: it computes rules the classics state, with confidence labels — no predictions, no guaranteed outcomes, no personal fortune readings.

黄历的「一天」和八字的「一天」一样吗？ Is the almanac "day" the same as the BaZi "day"?

黄历按民用日（午夜换日，UTC+8）；八字传统上子时起算，开启「晚子时」后 23:00 即进次日日柱。两者并行不悖，界面分别标示。

The almanac uses the civil day (midnight, UTC+8); BaZi traditionally turns at the zi-hour — with Late-zi on, 23:00 starts the next day pillar. Both views coexist and are labeled.

历法源流

How the calendar science came about

观天：圭表与节气 Watching the sky: gnomon and solar terms

农耕中国最早的历法需求是「跟住太阳」。古人立圭表测日影：影最长为冬至，最短为夏至——冬至由此成为整年的锚点。把黄道一周均分，便得指导农时的二十四节气；《淮南子·天文训》（西汉）已完整列出今名。

Agrarian China needed to track the sun. The gnomon (guibiao) measured noon shadows: longest at winter solstice, shortest at summer — making the winter solstice the anchor of the year. Dividing the sun's annual path yields the 24 solar terms; the Western-Han Huainanzi already lists today's full set.

调和日月：置闰 Reconciling sun and moon: leap months

月相周期约 29.53 天，回归年约 365.24 天；12 个朔望月约 354 天，比太阳年短 11 天。古人很早发现 19 年≈235 朔望月（中国谓之「章」，西方谓 Metonic 周期），故 19 年置 7 闰。至于闰在哪个月：含 13 个月的「岁」中，第一个不含中气之月为闰——本应用 1900–2100 逐月验证此规则（74 闰、0 违例）。

A lunation is ~29.53 days; the tropical year ~365.24. Twelve lunations fall ~11 days short, and 19 years ≈ 235 lunations (the zhang, a.k.a. Metonic cycle) — hence 7 leap months per 19 years. Which month leaps? In a 13-month sui, the first month containing no zhongqi. This app verifies that rule month-by-month for 1900–2100 (74 leaps, 0 violations).

干支：三千年不断的纪日 The sexagenary cycle: an unbroken day count

十天干与十二地支相配成六十甲子。殷商甲骨已用干支纪日；学界通说自春秋以来两千七百余年逐日连续未断——这正是任何日期的日柱皆可严格推算与核验的原因。后世更以干支纪年、纪月、纪时，构成八字四柱。

Ten stems pair with twelve branches into the 60-term cycle. Shang oracle bones already date days by ganzhi, and by scholarly consensus the day count has run unbroken for some 2,700 years since the Spring-and-Autumn era — which is why any date's day pillar can be computed and checked exactly. Years, months and hours later joined, forming the four pillars.

从皇朝历法到民间通书 From state calendars to the people's almanac

颁历为皇朝大政：汉《太初历》（前 104 年）定正月建寅之制；祖冲之《大明历》（510 年行用）引入岁差；元郭守敬《授时历》（1281 年）定岁实 365.2425 日；清初《时宪历》（1645 年，汤若望等以西法修订）改平气为定气——本应用按真太阳黄经推节气，正是定气之法。官历之外，民间刊本在历日上叠加建除、黄黑道、神煞宜忌，遂成家家可用的通书／黄历。

Promulgating the calendar was an act of state: the Taichu reform (104 BCE) fixed the first month; Zu Chongzhi's Daming calendar (in use 510 CE) added precession; Guo Shoujing's Shoushi (1281) set the year at 365.2425 days; the Qing Shixian calendar (1645, revised with Jesuit astronomy by Adam Schall and colleagues) replaced mean terms with true solar terms — the very method this app uses. Around the official calendar, popular printings layered officers, path gods and spirits, becoming the household Tong Shu.

典籍化与今天 Codification and today

清乾隆年间敕撰《协纪辨方书》（1739–1741 编成），系统整理并删汰互相矛盾的选择神煞，是后世通书的主要依据。今日农历由紫金山天文台依天文实测编算，国家标准 GB/T 33661-2017 明文规定定朔定气、东八区民用日与无中气置闰。本应用即沿此分界：天文历法层精确推算、可验证；择吉层如实编码典籍规则并标注置信度——「精确」与「分级」之分，正是全应用的诚实基线。

The Qianlong-era Xieji Bianfang Shu (compiled 1739–1741) systematized day-selection and pruned contradictory spirits, becoming the main basis of later almanacs. Today's lunisolar calendar is computed by the Purple Mountain Observatory, with GB/T 33661-2017 codifying true new moons/terms, the UTC+8 civil day, and no-zhongqi leaps. This app keeps exactly that division: a verifiable astronomical layer, and an interpretive layer encoded faithfully from named sources with confidence grades — the exact vs graded line the whole product stands on.
